CORNER GUARD

Corner Guards are used to protect finished wall corners from damage, especially in high traffic facilities like healthcare and hospitality. But there is a large range of available types so in this guide we will break down all the main types of corner guards, lengths, and widths and explain the benefits and main applications of each.

DO YOU NEED CORNER GUARDS ?

Not all corners need corner guards. Only facilities that have a lot of traffic, specifically with carts, gurneys, luggage, wheelchairs or other hard objects moving through the halls need corner guards. And they need them because the time and the cost for repairing a finished wall is very high.

If a finished corner is damaged the drywall needs to be repaired and then the wall paint matched and then painted. If it was a hard hit the corner bead might also have to be replaced in which case all the drywall from the floor to the ceiling would need to be patched.

Because corner guards are made from vinyl or plastic, they resist dents and scratches. They're not painted so there is nothing to chip off..

What Width Corner Guards Do I Need ?

Corner guards are available in widths from 3/4" to 3". The width you need depends on two factors: aesthetics and traffic. First, the width of your corner guard depends on how much you want it as part of the design of your space. The smaller the width, the less you will see it and vice versa.

Second, the more traffic and specifically the more traffic with carts and gurneys the higher the probability of damage is and the higher the probability of wider area of damage over which you need to protect. Thus the more traffic, the larger width you should purchase.

FOAM CORNER GUARD

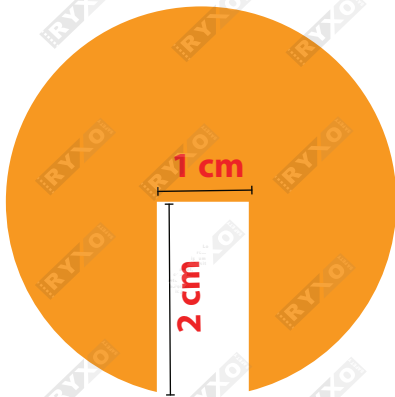

ITEM CODE	LENGTH	WIDTH (a)	INNER WIDTH (b)	THICKNESS (c)	COLORS	MATERIAL
	100 cm	5 cm	3.5 cm	1.8 cm		High Quality Foam

PU FOAM CORNER GUARD 1
